

Mcgraw Hill Anatomy Physiology 6th Edition

Mcgraw Hill Anatomy Physiology 6th

The human body is the structure of a human being. It is composed of many different types of cells that together create tissues and subsequently organ systems. They ensure homeostasis and the viability of the human body. It comprises a head, neck, trunk (which includes the thorax and abdomen), arms and hands, legs and feet. The study of the human body involves anatomy, physiology, histology and ...

Human body - Wikipedia

Surface anatomy (also called superficial anatomy and visual anatomy) is the study of the external features of the body of an animal. In birds this is termed topography. Surface anatomy deals with anatomical features that can be studied by sight, without dissection. As such, it is a branch of gross anatomy, along with endoscopic and radiological anatomy. ...

Liver Histology. The liver is the largest internal organ of the human body, weighing approximately 1.5 kg. Embryologically it develops from the foregut and it spans the upper right and part of left abdominal quadrants. Anatomically the liver consists of four lobes: two larger ones (right and left) and two smaller ones (quadrate and caudate).

Embryology. The pharyngeal apparatus has been identified as the main embryological structure that gives rise to numerous components of the head and neck region. It is divided into arches, pouches, and clefts, which fuse and reshape throughout early development to give the adult structures of the head and neck. The apparatus begins to form around day 23 of embryonic development.

Acute ischemic stroke (AIS) is characterized by the sudden loss of blood circulation to an area of the

brain, typically in a vascular territory, resulting in a corresponding loss of neurologic function. Also previously called cerebrovascular accident (CVA) or stroke syndrome, stroke is a nonspecific state of brain injury with neuronal dysfunc...
